Download AutoCAD: AutoCAD has several layers, or views, of information. The central pane is the workspace, which contains tools to draw, edit, modify, annotate, shade, color, add blocks and constraints, align, and draft. You can select layers to see the specific information you want, such as the layout view, tag view, or notes. You can change layers in the current view, and you can create multiple views with different layers, one for drawing and one for editing. You can also edit attributes of selected layers and view, edit, and place objects in layers other than the current view. You can open other views and layers, and turn them into the current view, by clicking on the arrow in the top left corner of the central workspace area. Layers The workspace has several layers. The current layer is the active view or workspace, and the layer you are working on is the active layer. You can set the drawing area to multiple layers. When you zoom in on a drawing, the layers are represented as color rings. For example, the first layer below the center of the view is red, the second layer below that is green, and so on. As you zoom out, the color rings get larger. Views AutoCAD has two views that you can switch between: the active view and the layout view. The active view displays the most recently edited drawing, and is the default view when you create a new drawing. When you are in the active view, you can select layers, change view settings, zoom, pan, rotate, and turn off background objects. When you select the layout view, you can turn off the active view and turn on selected layers to see the objects on those layers. The layout view shows objects in a geometric way and has a grid with horizontal and vertical lines, but it

A novel lipase was purified from *Humicola insolens* to homogeneity. The enzyme showed maximum activity at 60 degrees C and pH 7. The apparent  $K_m$  and  $V_{max}$  values for p-nitrophenyl palmitate were 0.11 mM and 250 micromol/min mg for the purified enzyme, respectively. The enzyme was found to be quite stable at 60 degrees C for 3 h. In contrast to lipases of other fungal origin, the enzyme retained more than 60% activity after incubation at 50 degrees C for 3 h. The enzyme displayed broad substrate specificity for aryl acyl moieties. The enzyme also showed esterolytic activity on vinyl butanoate and vinyl decanoate, and the corresponding products were isolated and characterized by  $^1H$  and  $^{13}C$  NMR. Oleic acid was found to be the best acyl donor, and a nonpolar solvent such as hexane was the best solvent.John Ryno John Ryno (21 April 1797 - 21 August 1857) was an English politician.
