SheetCAM TNG Screenshots:Oncogenic Pim-3 enhances the growth, invasion, and adhesion of gastric cancer cells in vitro and in vivo. Pim-3 is one member of a family of proline-directed serine/threonine protein kinases implicated in tumorigenesis. Recent evidence has suggested that Pim-3 acts as an oncogene in several types of cancer, but the precise role of Pim-3 in gastrointestinal carcinogenesis remains unclear. Here, we examined the role of oncogenic Pim-3 in the progression of human gastric cancer. Expression of Pim-3 in human gastric cancer cell lines was detected by western blot analysis. The biological functions of Pim-3 in human gastric cancer cell lines were investigated by lentivirus-mediated overexpression, small interfering RNA (siRNA)-mediated knockdown, and ectopic expression. Mice with Pim-3 knockdown were injected with gastric cancer cells to establish a gastric cancer cell xenograft model, and then, the effects of Pim-3 on tumor formation in vivo were assessed. Pim-3 expression was elevated in human gastric cancer cell lines and was correlated with the aggressiveness of gastric carcinoma. Pim-3 was localized in the cytoplasm and was required for cell cycle progression. Pim-3 is essential for tumor cell proliferation and anchorage-independent growth, and it may contribute to the metastatic potential of cancer cells. Pim-3 inhibits the apoptosis of gastric cancer cells, and it enhances cell-extracellular matrix (ECM) and cell-cell adhesion. Mice with Pim-3 knockdown show reduced growth rates of subcutaneous and metastatic tumors. In vivo functional analysis demonstrated that Pim-3 promotes tumor growth and metastasis in the mouse tumor xenograft model. Inhibition of Pim-3 suppresses angiogenesis and up-regulates matrix metalloproteinase (MMP)-9 expression in vivo. Our study indicates that Pim-3 plays an oncogenic role in gastric cancer and may represent a potential therapeutic target for this disease

Download In the years that the manufacturing industry has been practicing, the use of 3D printing has been growing at a rapid pace. However, due to the reduction of the components' sizes and quantities, the need for 3D CAD designs has immensely increased and the time that they are going to take to produce has lowered a lot. Manufacturing metallic sheets used in the production of products such as airplanes, automobiles or refrigerators, require very intricate 3D designs. These sheets are not as easy to handle as other sheets for the manufacturing of typical products, like plastics or thin metals. This is why 3D printing of metals has become one of the most demanded services of 3D printing companies and this is expected to increase in the years to come. 3D printing companies need to provide the best quality of services and they have managed to have a tremendously precise printing method. This technique consists in using various types of 3D printers that are capable of laying down the designs to make the products for you. They are very sophisticated 3D printers that use the thermoforming technology and they are also known as FDM or the Fused-Filament Deposition technology. It is a very useful 3D printing method that allows 3D designs to be created and fused layer by layer, even if it might be made of thin materials such as steel, plastic or other metals. These products are completely unique as the ones that are using other 3D printing techniques and there is no other product that can be found with a result as perfect as the ones produced by 3D printing methods. With this technique, you will be able to increase productivity, shorten the time in b7e8fdf5c8
