Osteomyelitis, a pathological bone infection, is a debilitating disease and a major source of morbidity in bone. It results from bone microorganisms, invading from contiguous sites with disease, i.e. infections, in the soft tissues and/or subacute hematogenous seeding. Among the chronic and stubborn forms of osteomyelitis, those caused by methicillin-resistant Staphylococcus aureus (MRSA) are a major cause of morbidity. Despite the number of published articles on osteomyelitis, this review emphasises some less appreciated aspects of osteomyelitis, in particular the remarkable success in eradicating MRSA via marrow transplantation. Based on the pattern of clinical manifestations, osteomyelitis may be classified as 'wound-related', 'focal infection-related', 'non-union-related', 'abdominal','sinus-related', 'occult', 'infection-related' and 'paraphysitis'. Although most infections manifest localised infection, only certain localities are considered foci for osteomyelitis. The subsequent spread depends on the underlying

seeding. An early diagnosis is crucial 6d1f23a050
