## **Etab 9.7.4 With [NEW] Crack**

---

ACI 224R-01 references method 1 and 2 above and 3 european codes. The most confusing part is the table in which Nawy suggests 0.1mm crack width for water-tight structures. The whole document is for normal structures except this line. And people are following this line and refer to this document for water tight structures. I mean its just a suggestion and by the way this method 1 is obsolete now since ACI 318-99 (see point 2 above).-Water tight structures-1. ACI 318-08 states clearly that for watertight structures ACI 350-06 codes should be used.2. Thank you for providing such a useful share. I want to share the link of this file:[bit.ly/3bJRdHy](http://bit.ly/3bJRdHy) It is a technical support forum for CSI ETABS 2020 Crack. Thanks again. Best, Paulo Rodrigo. Please visit the conference website to see the details and the link for registration. If there are any queries, please do not hesitate to contact the Conference Secretary at the following address Prof. Muhammad Masood Rafi Conference Secretary- SACEE-2019 Chairman Department of Earthquake Engineering NED University of Engineering & Technology Karachi, Pakistan. Phone: 0092-21-992-261261 Ext:2605 Email: rafi-mneduet.edu.pk. Dear members, I am working on a 10 storied rcc factory building with one basement, where floor loads are in general 125 psf(Live). But there are 2 warehouse in the building at ground floor & 10th floor where the Live load of stacked materials are 450psf. The forum belongs to the members so it never made sense for one person to be Admin, As always, feedback is much appreciated. Thanks for taking the time out to read this update. Cheers!. Hi guys just to discuss with you my understanding of crack widths in Environmental structures according to ACI.-Normal structures-1. ACI 318-95 based on statistical method of Gergely & Lutz 1968 limits Z based on exposure. We are calculating crack widths here. (Normal structures)2. ACI 318-99 proposed limiting the spacing and removed actually calculating the width and also removed the exposure conditions. For example for beams and one-way slabs  $s \text{ (in)} = 540/f_s - 2.5$  or in other words limiting the  $f_s = 0.6f_y$  (For normal structures)3.
