Photoshop Creative Cloud features many things I've used many times before. It has basic tools like adjustment layers, guides, a reference box, and dozens more that I use every day — things like Layer masks, blend modes, and the Width tool that lets you line up rectangular elements. Each tool has a keyboard shortcut and in-app help. The application has many features that make it easy to quickly manipulate your images. You can apply filters, add effects, work with the brush tool, or change the blend mode to make your photos more interesting. M-F, I'll use Photoshop for desktop image manipulation. I'll use Lightroom for video editing, when I'm not using a Firewire or USB to SDHC adapter. Photoshop for page layout, and Illustrator for vector art. I've been using Photoshop since Windows Me, and I do all document editing in Photoshop. I'll use Pixelmator for iPad and Mac, and DrawPlus for Android and tablet. I taught myself Photoshop in 1992, and spent half the day fighting the computer, not the software, when I had it in the late 1990s. It wasn't until I went to San Francisco and saw a class of 20-year-olds teaching themselves Photoshop that I decided it needed to be better. I spent a year ripping pages from books of professional photographers who had flicked through the very same copy of the *Bulletin of the Atomic Scientists* I was using to teach myself the principles of composition and design on the Mac Plus II I had. PC Magazine came calling, and PC Performance Review followed. I desperately needed something better than the Emulsion–CMYK–Cross process workflow I was running. In 2005, I went to the **Photoshop** Howwood Finishing Seminar at Katholieke Universiteit Leuven in Belgium, where I learned the layering technique, and I immediately handed back my cameras, switched to film, and figured there was no point in teaching myself Photoshop anymore.

This was initially called as Autotiling, and was called as the same in later versions of Photoshop. Unfortunately this feature is was very buggy and when it was enabled in/under Photoshop Elements and Illustrator Autotiling caused the element or shape to be completely unresponsive-probably due to the fact that the temporary floating elements were not available for the autotiling API to work upon. This Autotiling feature is not felt much in the current Photoshop as the same functionality is implemented in the context of layers in Photoshop. However Autotiling was still present in earlier versions of Photoshop. In the past, you could drag an element with the layer set to Movable to create a layer (a new floating element on the layer) and place it anywhere on the canvas. This would slightly modify the canvas and the newly placed element would be rendered with the layer automatically. But unfortunately this is no more the new Photoshop. However, these are still seen in earlier versions of the software. When you drag a floating element to the canvas, there will be a temporary layer created on the canvas and it will be placed where you drop it on the canvas. As far as I know, this is the most desired Autotiling feature or the one which was the probably the more troublesome one. If you drag an element (a slider, for example) that has not yet been placed on the canvas, and drop that slider on an existing floating element, it will replace/replace the floating element on the canvas. You can also drag a slider or an existing floating element to a layer and place it anywhere on the canvas.

Modifying the amount of noise that's in your image can make a significant difference to the apparent sharpness of an image. You'll find the layers with Noise Reduction Patterns, which add additional noise in uneven areas of an image to improve the perceived overall quality of the image. While Noise Reduction does utilize a significant amount of processing and memory, it's an effective way to improve image quality. If you work with images shot digitally or scanned, you may have encountered overcaptured highlights in your images. For example, the highlights along the edge of your car can be a tad brighter than the rest of the image, and it can look very unsightly. This is caused by the sensor of your camera having more light sensitive pixels than the rest of the sensor. It's not possible to do anything about the legitimate highlights in the image, but you can remove the overblown highlights and bring the rest of the image back into the appropriate tone range.
