Editing a layer is similar to editing a mask. You can create a selection tool by drawing the left or right side of the image by clicking-and-dragging. You can modify a layer with “light” tools; in this case, this usually means more of the “out of the way” edit tools. You can create a photo filter layer type by clicking the circular icon at the top of the dialog. From there, you can add filters to the layer type: sepia, vintage, grainy, and so on. Once the filters are created, you can give the layer type a name and make it a smart object of the file. For example, I have used the layer type to place a black strip across one of my images. This is a useful feature for dimensioning. After you’ve set up the layer type, you can continue to create layers. You can select from the current layer options on the layer panel or add any adjustments or filters to the layer. Depending on what adjustments have been made, the layers that fall under it. In terms of operation, Lightroom does crop along with resizing, but that's where the similarities to the previous version end. After this crop, we are still able to see the histogram in the preview as in previous versions. Also, it is possible to change the White Balance, Exposure and Sharpness in the same window. That's only possibly because Lightroom can provide read-only access to the RAW file that's opened for editing. The RAW file used in this review is a minimal version of Sky-30, the new RAW format, with all the default settings turned on (lots of DR, SWIs, WBFA, high ISO). Unfortunately, Lightroom doesn't recognize it as a RAW file, although it shows a preview of the.DNG file. This is the first time that RAW conversion speed has been a problem for me in Lightroom. You can see the difference compared to SilkyPix shown earlier - probably a memory limitation (the trade-off for faster RAW conversion in Lightroom 5), or a problem with either the processing software or the RAW file. Even after a rebooting, I can't get the same speed as I could with Silkypix. It doesn't seem to make a significant difference if the files were actually imported or if they are imported into the original image size. Either way, Lightroom 5 is clearly not meant to be a fast processing tool. However, for me at least, it will still do what I need to do.
